2. Data from the 2006–2008 National Survey of Family Growth (NSFG) indicate that from 2005 to 2008, 24 percent of children were born to cohabiting parents and 16 percent were born to a single mother.

4. Data from the NSFG indicate that 71 percent of children were living with both of their parents at age fourteen in the 1980s, compared to 65 percent in the 2000s (2000–2007).

9. For example, T. Hanson et al., find that remarriage decreases parental supervision and lowers college expectations for children. Sara S. McLanahan and Gary Sandefur show that children whose mothers remarried had no higher rate of high school graduation (or lower levels of teen child-bearing) than did children living with single mothers. For example, one recent study found that 81 percent of children living in nonmarried households will experience poverty during the course of their childhood, compared to 22 percent of children living with married parents. Fifty-two percent of children in nonmarried households will experience dire poverty (income 50 percent or less of the official poverty threshold) compared to just 10 percent of children in married households.
